

for features $f_1, f_2, \dots, f_3$
we call them independent features

Similarly f_{op} is called the output feature or dependant feature

A dataset consists of dependant and independent features. A model is trained on this dataset.

features can be of different types, continuous, categorical, while some can be entirely textual in nature.

However, if the data is in the form of text, we will need to use NLP to convert the textual data in the form of meaningful vectors.

NLP is getting really popular these days for eg Alexa, Google Home, Spam Classification etc.

Roadmap to learn NLP
